DETAILED ACTION
REASONS FOR ALLOWANCE

Claims 1, 3-7, 9-19 are allowed.

The following is an examiner's statement of reasons for allowance: The present invention is directed to a method for implanting an adaptive mixing energy ratio in an image-editing environment.

The following is a statement of reasons for the indication of allowable subject matter: The independent claim 1 identifies the uniquely distinct feature for "non-predefined audio patterns wherein the predefined auditory pattern include audio clips in an audio database comprising at least one of specific music melodies, specific speech sentences, specific sounds of living creatures, and specific sounds of special events"

Nakamura et al., US 2005/0025454 discloses this invention realizes an editing system and control method thereof capable of significantly improving working efficiency of editing work. A proxy editing terminal device creates an EDL with low-resolution video/audio data, resulting in reducing time to create the EDL. Further, the low-resolution video/audio data and high-resolution video/audio data having the same contents and different resolutions are previously stored, so that the creation of a final edit list with the high-resolution video/audio data based on the EDL can be started in a short time after the EDL is created with the low-resolution video/audio data. Thus

working efficiency of the editing work can be significantly reduced with reducing time to create the EDL and the final edit list.

Arredondo et al., GB 2387710 discloses the system is configured to cut (102) the digital video footage (100) into a plurality of clips and sort (104) those clips into groups. A group identifier associated with each of the groups is presented on a screen or display (107). The groups can be selected by a user so that the clips contained therein can be used. The cutting can be done automatically using a cutting algorithm, e.g. based on a histogram, or by intensity edge determination. Clips may be classified according to predetermined criteria e.g. camera motion, optical flow, image quality, scene changes, photometric characteristics level of blurring and contrast detection.

Anderson et al., US 7,248,778 discloses a video editing system uses simple heuristics and parameters on video footage to provide a condensed version of the footage. The editing system automatically provides either a finished condensed version of the footage or selects a plurality of clips based on the heuristics and parameters. The clips are optionally further edited by a user to produce a condensed version. The condensed version is transferable to any desired media suitable for storing video. A user interface enables the user to select heuristics to identify video clips from the footage. Parameters are also be set to automatically edit the clips in a desired manner. Temporal combinations of heuristics and parameters form templates, which are used to assemble desired clips for selected types of events.

None of the prior art, either singularly or in combination, fails to anticipate or render the above underlined limitations obvious. Claims 3-7, 9-19 are dependent on claims 1 and 14 and therefore dependent claims also allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
